Note: Footnote style numbers in this draft refer to corresponding numbers in “Best Available Science/Guidance-Flood and Channel Migration Hazard Areas” (2005, draft). That document contains excerpts from scientific literature that are relevant to the draft regulations.

24.20.005 Frequently flooded areas – Purposes.
The purposes of this section are to:

A. Augment development standards in chapter 14.38 TCC regarding development in flood hazard areas.

B. Identify areas affected by natural flooding and stream channel migration and minimize the amount of development at risk in such areas in order to protect human life and safety; minimize damage to homes and places of business; minimize business interruptions; avoid or minimize damage to public facilities and utilities including, but not limited to, water and gas mains, electric, telephone and sewer lines, roads and bridges; and to minimize the expenditure of public funds for flood control projects, rescue and relief efforts and repair of flood damage.

C. Preserve natural flood control by retaining the capacity of floodways to pass floodwaters and associated debris and by retaining the capacity of floodplains to store flood waters.

D. Restrict structures, facilities, flood loss reduction measures (including, but not limited to, hard armoring and stream channelization), grading, dredging, filling and other development in areas subject to flooding that could displace flood carrying capacity or increase flood heights or velocities.

E. Protect the quality and quantity of water sustaining humans, fish, shellfish and wildlife by avoiding or minimizing siltation and pollution associated with flooding. This includes, but is not limited to, prohibiting or restricting uses in flood prone areas that pose significant risks to water quality when they are inundated.

F. Minimize disruption of stream channel migration that forms fish and wildlife habitat by minimizing streambank stabilization and construction of new structures that would be affected by stream channel migration.

G. Maintain the linkages of the stream to the nutrient reserves in its floodplains.

H. Regulate frequently flooded areas as a critical area, pursuant to RCW 36.70A.030.

24.20.010 Frequently flooded areas – Applicability.
The provisions of this chapter apply to frequently flooded areas and one-hundred year channel migration hazard areas as defined in chapter 24.03 TCC.

24.20.015 High ground water flood hazard areas – Base flood elevation.
The base flood elevation (BFE) for high ground water flood hazard areas corresponds to the elevation of the outer edge of the high ground water flood hazard area. The map entitled “High Ground Water Flood Hazard Areas,” depicts the approximate location of the high groundwater flood hazard area. The actual location of the outer edge of the flood hazard area shall be determined consistent with TCC 24.20.030 and 24.20.035, as applicable.
Footnote style numbers in this draft refer to corresponding numbers in “Best Available Science/Guidance-Flood and Channel Migration Hazard Areas” (2005, draft). That document contains excerpts from scientific literature that are relevant to the draft regulations.

24.20.020 High groundwater flood hazard areas – No development zone.
The no development zone (NDZ) is an area extending fifty feet, measured on a horizontal plane, from the outer edge of the high ground water hazard area or extending to a ground elevation two feet (vertically) above the base flood elevation, whichever is less. Development is prohibited in the no development zone.

24.20.025 High groundwater flood hazard areas – Restricted development zone.
In situations where the no development zone is based on elevation, there may not be a restricted development zone (see Figure 24.20-1). The restricted development zone (RDZ) extends from the outer edge of the no development zone to a ground elevation two feet (vertically) above the base flood elevation, except:

A. The approval authority may exclude areas less than two feet in elevation above the base flood elevation from the restricted development zone if the applicant’s registered professional civil engineer licensed in the State of Washington demonstrates that due to drainage patterns (including the location and size of any existing culverts and ditches), topography, physical barriers, geologic conditions, hydrology, distance from the high groundwater flood hazard area or other relevant factors that the area proposed to be removed from the restricted development zone and adjacent properties will not flood. The approval authority may consult with an engineering geologist, hydrogeologist, professional engineer, or other qualified professional as necessary, at the applicant’s expense, to evaluate the flooding potential of the area proposed to be removed from the restricted development zone. The County shall provide the applicant with a cost estimate and obtain their approval prior to consulting with the experts. The application may be closed if the applicant chooses not to bear the cost of the evaluation; or

B. On sloping parcels where the topography does not reach two feet in elevation above the BFE before it falls in elevation below the base flood elevation, the approval authority shall set the outer boundary of the restricted development zone at the highest point above the base flood elevation (see Figure 24.20-2), if the applicant’s registered professional engineer licensed in the State of Washington demonstrates that the area beyond has no or negligible risk of flooding. The approval authority may consult with an engineering geologist, hydrogeologist, professional engineer, or other qualified professional as necessary, at the applicant’s expense, to evaluate the flooding potential of the area proposed to be removed from the restricted development zone. The County shall provide the applicant with a cost estimate and obtain their approval prior to consulting with the experts. The application may be closed if the applicant chooses not to bear the cost of the evaluation; or

C. All new construction proposed in the restricted development zone shall comply with the provisions of this section and TCC 14.38.050.

---

**24.20.030 High groundwater flood hazard area – Delineation.**

A. High groundwater flood hazard areas shall be delineated through a critical area review permit.

B. Applicants for development of an existing lot shall submit the base flood elevation, prepared by a licensed land surveyor, for review and approval of the director, consistent with TCC 14.38.040, as follows:
Note: Footnote style numbers¹ in this draft refer to corresponding numbers in “Best Available Science/Guidance-Flood and Channel Migration Hazard Areas” (2005, draft). That document contains excerpts from scientific literature that are relevant to the draft regulations.

1. The applicant’s surveyor, in consultation with the director, shall stake and flag the recommended high ground water edge in the field based on the High Ground Water Flood Hazard Areas Map, topography, aerial photographs of flood events and other relevant factors.

2. After the director accepts the staked and flagged high ground water edge, the surveyor shall depict the BFE, NDZ, and RDZ on the site plan submitted to the director for review and approval.

24.20.035 High groundwater flood hazard area – Map amendments.
A. The High Groundwater Flood Hazard Area map shall be amended consistent with the review process and requirements specified in chapters 24.05 and 24.91 TCC.

B. All required hydrological studies shall be prepared by an engineering geologist or professional engineer licensed in the State of Washington with demonstrated experience, as appropriate, in hydrologic, hydrogeologic and hydraulic analysis.

24.20.040 River, marine, lake, and coastal flood hazard areas – Map amendments.
Map amendments of maps for frequently flooded areas that are identified on the Flood Insurance Rate Maps prepared by the Federal Insurance Administration, as supplemented by "The Flood Insurance Study for Thurston County," dated November 17, 1980 shall follow the amendment procedure in TCC 14.38.090, Map correction procedures.

24.20.045 Channel migration hazard areas – Map.
The 100-year channel migration hazard areas are generally depicted on the map entitled “Channel Migration Hazard Areas” on file with the department in the Permit Assistance Center.

24.20.050 Channel migration hazard areas – Map amendments.
A. Maps of channel migration hazards areas shall be amended consistent with the review process and requirements specified in chapters 24.05 and 24.91 TCC.

B. The department shall periodically update the map as the County delineates or accepts delineations of 100-year channel migration hazard areas pursuant to this chapter.

1. The required data must be prepared by a qualified professional proficient in fluvial geomorphology (i.e., a person who possesses a graduate degree in Geology or Physical Geography with specialization in fluvial geomorphology and has at least two years of relevant professional experience).

2. Any third party review shall be performed by a qualified professional proficient in fluvial geomorphology. Based on this evaluation, the approval authority will modify the Channel Migration Hazard Areas Map if warranted.
Note: Footnote style numbers in this draft refer to corresponding numbers in “Best Available Science/Guidance-Flood and Channel Migration Hazard Areas” (2005, draft). That document contains excerpts from scientific literature that are relevant to the draft regulations.

24.20.055 Channel migration hazards areas – Delineation – Unmapped hazard areas.
If the approval authority determines that a proposed use along a Type S or F stream is within a historic channel migration zone, based on field conditions, historic information, LIDAR imagery or aerial photography, and the 100-year channel migration hazard area has not been mapped, the approval authority shall require the applicant to determine if a 100-year channel migration hazard area is present on the site and, if so, delineate its location and extent.

A. The determination as to whether the 100-year channel migration hazard area affects the subject property shall be based on the findings of a qualified professional proficient in fluvial geomorphology using a reliable methodology to determine channel migration accepted by the department (e.g., as described in the Washington Department of Natural Resources’ Forest Practices Board Manual, Standard Methods for identifying Channel Migration Zones and Bankfull Channel Features, dated 8/2001, as amended; or in “A Framework for Delineating Channel Migration Zones,” Washington Department of Ecology, 2003, as amended). Maps delineating the 100-year channel migration hazard area shall be of a scale and format specified by the department.

B. The following areas shall be considered outside of the 100-year channel migration hazard area:

1. Areas separated from the stream channel by a legally established structure that the approval authority, in consultation with a qualified professional, determines will block channel migration. This may include, but is not limited to, dikes, levees and public roads that extend above the 100-year flood elevation that are constructed to remain intact through a 100-year flood. Constraints to channel migration that do not extend above the 100-year flood elevation shall not be considered to limit channel migration unless demonstrated otherwise based on technical information; and

2. Areas separated from the stream channel by a geologic feature, such as a rock outcrop, that the approval authority determines, in consultation with a qualified professional, will stop channel migration.

24.20.060 Frequently flooded areas – Building setbacks – Coastal flood hazard areas.

A. Coastal flood hazard areas. Uses in coastal flood hazard areas are allowed landward of the reach of mean high tide, subject to the provisions of chapter 14.38 TCC. New construction, additions affixed to the side of an existing structure, and substantial improvement of any structure with a crawl space may only be located landward of a line three feet above the regulatory tidal base flood elevation, consistent with chapter 24.25 TCC and the Shoreline Master Program for Thurston Region.

B. Refer to chapter 14.38 TCC regarding crawl spaces.
24.20.065 Floodways – Development and uses.
Encroachments, including new construction, substantial improvements, fill and other development, are prohibited within designated floodways.

A. In addition to the requirements of chapter 24.45 TCC, a reasonable use exception for development in a floodway shall be required to demonstrate the following:

1. Hydrologic and hydraulic analyses performed by a registered professional engineer licensed in the State of Washington, that demonstrate, in accordance with standard engineering practices, that the proposed project will not result in an increase in flood levels during discharge of the base flood.

2. New construction and substantial improvements, as defined in TCC 14.38.020 shall comply with all applicable flood hazard reduction provisions in chapter 14.38 TCC.

B. Recreational vehicles.

1. Recreational vehicles parked in the floodway shall not be left unattended for more than twenty-four consecutive hours during the flood season, between November 1 and March 15; and

2. Travel trailers parked in the floodway shall have the wheels and tongue attached for ease and rapidity of evacuation. Only quick disconnect utilities may be used. Permanent additions to travel trailers parked in the floodway are prohibited.

C. Temporary structures and hazardous materials shall be removed from the floodway during flood season (i.e., November 1 to March 15). If the approval authority determines that flooding is imminent and the owner is not present, they may, at the owner’s expense, move the structure(s), its contents, and any vehicles to higher ground.

D. For any approved development in the floodway, a notice shall be recorded on the property title indicating that its use is subject to title 24 TCC and chapter 14.38 TCC.

E. Projects specifically designed to protect, create or restore anadromous/native fish habitat may be allowed in or along Type S and F streams without the hydrologic and hydraulic engineering analysis, if the approval authority determines that the project will not significantly obstruct flood flows or increase flood elevations. If the effect of the proposed project on flooding is in doubt, the approval authority may require that a qualified professional in the field of hydraulics review the proposed project consistent with Paragraph (A)(1) above, at the applicant’s expense, in order to determine if it will exacerbate flooding.
Note: Footnote style numbers\textsuperscript{1} in this draft refer to corresponding numbers in “Best Available Science/Guidance-Flood and Channel Migration Hazard Areas” (2005, draft). That document contains excerpts from scientific literature that are relevant to the draft regulations.

24.20.070 Frequently flooded areas – Standards and allowable uses and activities.
Table 24.20-1 identifies the land uses and activities that are allowable in frequently flooded areas (i.e., 100-year floodplains, 100 year flood zone (1% flood zone), floodways, high ground water hazard areas/restricted development zones, channel migration hazard areas, and coastal flood hazard areas) and 100-year channel migration hazard areas. All land uses and activities not allowed by or not mentioned in Table 24.20-1, except water dependent uses allowed under the Shoreline Master Program for Thurston Region, are prohibited within the flood and channel migration hazard areas regulated by this section, except as otherwise provided in chapter 24.01 TCC.\textsuperscript{2} In addition to this chapter, these allowable uses and activities may be subject to the following:

A. Other applicable provisions of this title and requirements of the applicable zoning district;

B. The provisions of chapter 14.38 TCC, Development in Flood Hazard Areas;

C. The Shoreline Master Program for the Thurston Region;

D. The Drainage Design and Erosion Control Manual for Thurston County, as amended (chapter 15.05 TCC); and

E. All other applicable county, state, and federal regulations.

O:\Track\LONG RANGE PLANNING\CAO\CAO Title Reformat\BoCC Public Hearing Draft\BOCC Hearing Clean Copies\10_BPH_Chapter_24.20_Frequently_Flooded_Areas_Clean.doc
24.20.080 Frequently flooded areas – General standards.
The following requirements apply, as applicable, to all uses and activities listed in Table 24.20-1.

A. Applications to undertake a use or activity within frequently flooded areas or a 100-year channel migration hazard area shall contain all information necessary to evaluate the proposed activity, its impacts, its compliance with the applicable provisions of this chapter and chapter 14.38 TCC, Development in Flood Hazard Areas.

B. All development in frequently flooded areas and 100-year channel migration hazard areas shall be designed to avoid habitat degradation, consistent with chapter 24.25 TCC, Fish and Wildlife Habitat Conservation Areas.\(^4\)

C. Development in frequently flooded areas shall be designed so it does not increase flood hazards, except as provided for in this section and chapter 14.38 TCC.

D. The approval authority shall deny proposed developments and uses if it is determined that they would require structural flood hazard reduction measures including, but not limited to, channeling the floodway or creating a new impact upstream or downstream at the time of construction/implementation or anytime thereafter, except as provided for in chapter 24.25 TCC.

E. Excavation and development shall be prohibited in the 100-year floodplain of Type S and F streams if the approval authority determines that it would cause significant dewatering of the hyporheic zone (the saturated zone located beneath and adjacent to streams with subsurface flow between surface water and the water table), block ground water flow or significantly inhibit recharge of the hyporheic zone. The approval authority may require the applicant to submit data as necessary to determine if excavation, soil compaction, or impervious surfaces associated with the project would cause significant, detrimental disruption to the ground water system.

F. The degree of flood protection required by this chapter is considered reasonable for regulatory purposes and is based on scientific and engineering considerations. Larger floods can and will occur on rare occasions. Flood heights may be increased by manmade or natural causes. This chapter does not imply that land outside of frequently flooded areas or usages permitted within such areas will not be subject to flooding or flood damage. This chapter shall not create liability on the part of Thurston County, any officer or employee thereof, or the Federal Insurance Administration, for any flood damages that result from reliance on this chapter or any administrative decision lawfully made hereunder.

24.20.090 Frequently flooded areas – Clearing and grading.
Clearing and grading within frequently flooded areas, channel migration hazard areas, and in the restricted development zone associated with high groundwater flood hazard areas is only allowed in conjunction with a use permitted pursuant to this chapter if it complies with all of the following:

\(^1\) Note: Footnote style numbers in this draft refer to corresponding numbers in “Best Available Science/Guidance—Flood and Channel Migration Hazard Areas” (2005, draft). That document contains excerpts from scientific literature that are relevant to the draft regulations.
A. Clearing and grading are the minimum necessary to accommodate the permitted use, as determined by the approval authority.

B. The soil duff layer shall remain undisturbed to the maximum extent practicable. In areas that are disturbed during construction but will not be covered by impervious surfaces, the moisture-holding capacity of the topsoil layer shall be maintained by minimizing soil compaction, by amending the soil with compost (consistent with TCC 24.20.100) or by stripping, stockpiling and reapplying the topsoil. Where feasible and appropriate, as determined by the approval authority, graded soil shall be redistributed to disturbed areas on the project site, provided it does not increase the flood elevation and complies with other applicable provisions of this chapter and chapter 14.38 TCC.

C. The clearing limits shall be marked with a temporary fence authorized by the County.

D. Clearing and grading shall only occur between May 1 and September 30. The County may temporarily suspend grading during this period if excessive rainfall could cause erosion and sedimentation that would affect a wetland or water body. The County may allow clearing and grading outside of this period if all drainage will flow away from all potentially affected wetlands and water bodies, remain on site and the site is stabilized per chapter 15.05 TCC.

E. Clearing in channel migration hazard areas. See chapter 24.25 TCC regarding clearing restrictions in riparian management zones.

(Also see chapter 14.20 TCC regarding grading requirements and the Stormwater and Drainage Design Standards for Thurston County, chapter 15.05 TCC, chapter 24.25 TCC and chapter 14.38 TCC)

24.20.100 Frequently flooded areas - Fill.

A. High ground water flood hazard areas.

1. No fill may be placed within a designated high groundwater flood hazard area or no development zone, except to the minimum extent necessary, as determined by the approval authority, to elevate existing access roads serving existing, developed lots to the base flood elevation. Any such fill material shall be stabilized consistent with TCC 14.38.050(A)(5).

2. Fill may be used in the restricted development zone as follows:

   a. The approval authority may approve balanced cut and fill to the minimum extent necessary for construction of an approved use listed in Table 24.20-1, if a professional civil engineer licensed in the State of Washington demonstrates that the fill or grading will not block natural drainage or increase flood hazards on or offsite.
Note: Footnote style numbers in this draft refer to corresponding numbers in “Best Available Science/Guidance-Flood and Channel Migration Hazard Areas” (2005, draft). That document contains excerpts from scientific literature that are relevant to the draft regulations.

b. Fill may be used to the minimum extent necessary, as determined by the approval authority, to construct a road to access essential public facilities or primary structures if no less damaging or hazardous alternative location exists for the access road outside of the restricted development zone. The access road’s surface shall be constructed to an elevation equal to the base flood elevation.

c. The approval authority may allow the road to be elevated up to two feet above the base flood elevation provided arched, bottomless culverts will be installed to allow passage of water and the applicant’s professional civil engineer licensed in the State of Washington demonstrates that flooding will not be increased offsite or inundate structures.

d. Fill material authorized pursuant to this section and any subsequent stabilization shall be such that the fill is stable during flooding, consistent with TCC 14.38.050(A)(5).

B. Floodplain. The approval authority may approve balanced cut and fill with compensatory flood storage within the 100-year floodplain, landward of the floodway, to the minimum extent necessary for construction of an approved use listed in Table 24.20-1 or to provide access to essential public facilities, if a qualified professional engineer licensed in the State of Washington and a qualified wildlife habitat biologist demonstrate that there is no other alternative method for constructing the proposed use and that such grading and filling will not block stream side channels, increase flood hazards, inhibit channel migration or degrade important habitats (see chapter 24.25 TCC).

C. Coastal flood hazard areas. Fill for structural support of buildings is prohibited in coastal high hazard areas.

24.20.110 Frequently flooded areas – Flood hazard reduction.
Proposals for flood hazard reduction shall be consistent with chapter 24.25 TCC.

24.20.120 Frequently flooded areas – Hazardous facilities and materials.

A. Storage of hazardous materials, sewage sludge, fertilizers, pesticides, herbicides, or chemical or biological substances defined as a hazardous/dangerous waste in chapter 173-303 WAC, or any other substances, solids or liquids in quantities regulated by TCC 24.10.140, shall be stored out of floodways and above the 100-year flood elevation consistent with Chapter 14.38 TCC where they are at least risk of being inundated with floodwater, consistent with chapters 173-303 WAC and 173-360 WAC, chapter 14.32 TCC, International Fire Code, and Article VI of the Rules and Regulations of the Thurston County Board of Health Governing Nonpoint Source Pollution.
Note: Footnote style numbers in this draft refer to corresponding numbers in “Best Available Science/Guidance-Flood and Channel Migration Hazard Areas” (2005, draft). That document contains excerpts from scientific literature that are relevant to the draft regulations.

B. The director may require removal of temporary staging areas or stockpiles of equipment, materials or substances in the floodway and/or floodplain between November 1 and March 15 if it is determined that such use or activity is hazardous to the public health, safety or welfare.

C. Use and storage of hazardous materials at typical residential scale are allowed for legally approved residential uses, subject to applicable sections of the Thurston County Code and Thurston County Sanitary Code.

24.20.130 Frequently flooded areas – New on-site sewage disposal systems.

A. New on-site sewage disposal systems shall be located outside the 100-year floodplain, floodway, coastal high hazard areas, and high ground water flood hazard areas, including the no development and restricted development zones. This may require systems that provide a higher level of sewage treatment. The sewage disposal system shall be located as far from the frequently flooded area as possible. Also see Article IV, The Rules and Regulations of The Thurston County Board of Health Governing Disposal of Sewage, and WAC 173-160-171.

B. New on-site sewage disposal systems shall be located outside the 100-year channel migration hazard area, except as provided in chapter 24.50 TCC. This may require systems that provide a higher level of sewage treatment. The sewage disposal system shall be located as far from the frequently flooded area as possible. Also see Article IV, The Rules and Regulations of The Thurston County Board of Health Governing Disposal of Sewage, and WAC 173-160-171.

C. Failing onsite sewage disposal systems shall be immediately remedied consistent with The Rules and Regulations of The Thurston County Board of Health Governing Disposal of Sewage, chapter 14.38 TCC, and, if applicable, chapter 24.25 TCC. The approval authority may require the applicant to demonstrate that due to physical constraints (e.g., topography, soil conditions or the configuration of the site), another site configuration would not allow the development to occur without intrusion or with less intrusion into the hazard area than the proposal.

24.20.132 Frequently flooded areas – Reclaimed water.
Section reserved for future critical area reclaimed water regulations. Standards will be proposed when more information is available to the county.

A. Residential and appurtenant structures, and typical residential-scale activities are prohibited, except as allowed under chapters 24.50 and 24.55 TCC, this chapter, and other applicable sections of the Thurston County Code and Thurston County Sanitary Code. Onsite septic systems, including those associated with residential uses, are addressed in TCC 24.20.130.
B. Use and storage of hazardous materials at typical residential scale are allowed for legally approved residential uses, subject to applicable sections of the Thurston County Code and Thurston County Sanitary Code.

24.20.140 Frequently flooded areas – Roads, bridges and culverts.

A. New roads, bridges, and culverts shall be designed to minimize interruption of the downstream movement of wood and gravel, minimize fill, and allow passage of 100-year flood flows and associated debris. Bridge piers and abutments shall not be placed in either the floodway or between the stream’s ordinary high water marks unless there is no alternative placement, the placement results in zero increase in the backwater elevation or increase in downstream hazards during the 100-year flood, and the placement minimizes habitat degradation. (See chapter 24.25 TCC regarding road alignments in riparian habitat areas.)

B. Clearing of culverts does not require a critical area permit, though state and federal permits may still be required. Clearing of culverts shall be limited to removal of sediment and debris from the culvert and its inlet, invert, and outlet.

Replacement of a road, bridge or culvert is allowed if necessary to conform to current standards and if:

A. It was lawfully established;

B. There is not another alternative available that has less adverse impact on the frequently flooded area;

C. The bridge or culvert is designed to avoid or, where that is not possible, minimize impacts to the frequently flooded area and it is in compliance with chapter 14.38 TCC.

D. The replacement is consistent with the provisions of TCC 24.25.130.

24.20.150 Frequently flooded areas – Stormwater retention, treatment, and conveyance facilities.

A. Maintenance and repair of existing stormwater retention, detention, treatment, and conveyance systems is permitted.

B. New stormwater facilities and swales proposed to store, treat and/or convey stormwater may be constructed consistent with the Drainage Design and Erosion Control Manual for Thurston County, as amended (chapter 15.05 TCC), and chapter 24.25 TCC.

C. Temporary sediment ponds are allowed in the RDZ associated with high ground water hazard areas between March 16 and October 31. Temporary ponds may be located in other
flood and channel migration hazard areas during this same time period if they comply with chapter 24.25 TCC.

24.20.160 Frequently flooded areas – Timber harvest.
The approval authority may authorize the cutting of hazard trees in floodways, 100-year floodplain, coastal high hazard areas, and 100-year channel migration hazard areas consistent with chapters 24.25 and 14.38 TCC.

24.20.165 Frequently flooded areas – Utilities.
A. New utility lines and facilities in rights-of-way. Installation of utility lines and facilities is permitted in existing rights-of-way within frequently flooded areas, channel migration hazard areas and associated buffers, consistent with applicable regulations (see title 13 and 14, TCC) and the provisions of this chapter. When possible, given physical and technical constraints, utility installation shall occur on the side of the utility corridor or road furthest from the hazard area. In the event that other critical areas are present, the approval authority, in consultation with others with expertise, shall determine where the proposed facilities would have the least impact on the critical areas and associated buffers. Mitigation of any impacts may be required consistent with the provisions of this title.

B. Individual service lines.

1. Overhead lines and cables serving an individual use are permitted in frequently flooded areas, channel migration hazard areas, and their associated buffers if:
   a. They meet state and federal requirements;
   b. The alignment has the least impact on the critical area and buffer;
   c. They do not adversely impact anadromous fish; and
   d. The alignment meets the requirement of chapter 14.38 TCC.

2. Buried service lines serving an individual use are permitted in frequently flooded areas and associated buffers, with the exception of floodways, consistent with this chapter. The construction of utility service lines shall not have more than a temporary adverse impact. The site shall be restored upon completion of the installation.

C. New transmission lines/utility corridors.

1. Where possible, new transmission and distribution lines, and cables crossing frequently flooded areas or buffers shall be contained within an existing roadbed, railroad bed, bridge, elevated walkway, conduit, or other disturbed area where they would have the least adverse impact. If the utility lines will be consolidated with or parallel to an existing utility crossing, they shall be located at the minimum
separation distances established by the county for such uses, so long as the minimum
distances so established also meet the applicable industry, state and national gas and
electric safety standards.

2. The approval authority shall not authorize a new utility corridor within a frequently
flooded area or channel migration hazard area unless the applicant demonstrates that
there is no alternative available outside the critical area. When proposing to cross
frequently flooded areas and channel migration hazard areas, the applicant shall
demonstrate to the approval authority’s satisfaction that the crossing is essential and
there is no alternative alignment or crossing method. This shall include identification
of the alternative alignments, crossing methods (including boring), their feasibility,
and potential impacts.

3. When it is necessary to cross a frequently flooded area or channel migration hazard
area, the corridor shall be in compliance with the following standards:

   a. The corridor shall be aligned where it would have the least impact. Where
crossing is permitted, the least damaging alternative method and alignment
shall be used, including the minimum width practical.

   b. The utility corridor shall provide for other necessary uses and facilities
whenever possible. Conduit containing new utilities shall be sized to provide
capacity for additional lines and cables in the future.

   c. If the approval authority determines that overhead lines or lines buried in
trenches would be detrimental to dependent fish or wildlife, the proposed
crossings shall, when physically feasible, be accomplished by boring beneath
the critical area. Entrance and exit portals shall be located outside of the
critical area, if possible. Bore pits shall be restored upon project completion.

      i. If trenching or boring is proposed to be used to accommodate utility
lines, the applicant shall evaluate its effect on the flow of
groundwater. The approval authority may call upon technical experts
as needed, at the applicant’s expense, to evaluate the report.

      ii. Trenching and boring shall not be required/allowed if it would
interrupt the ground water connection to the extent that the stream or
dependent wildlife would be damaged.

   d. Utility corridors shall be revegetated with appropriate native vegetation, at
not less than preconstruction densities. Restoration shall occur immediately
upon completion of construction or as soon thereafter as possible due to
seasonal constraints or work windows established pursuant to this chapter.
The applicant shall submit a performance surety consistent with chapter
24.70 TCC to ensure that the planted vegetation survives or is replaced.
e. Staging areas for equipment and materials shall be located outside of the critical area and buffer.

f. Applicants shall submit a maintenance plan for approval by the county consistent with the provisions of this chapter.

24.20.170 Frequently flooded areas – Vegetation removal.
Harvesting of plants and plant materials is permitted in flood hazard and channel migration hazard areas consistent with chapters 24.25 and 24.30 TCC.  

24.20.180 Frequently flooded areas – Wells.
New wells shall be located outside the 100-year floodplain, floodway, coastal high hazard areas, high ground water flood hazard areas, and the high ground water flood hazard area no development zone. Within 100-year channel migration hazard areas, new wells are permitted, subject to chapter 24.50 TCC. Wellheads shall be located a minimum of two feet above base flood elevation. The well and all approved appurtenances shall be located as far from the frequently flooded area as possible. Also see WAC 173-160-171.
